## Applied Maths

Applied Maths is a subject based on the applications of mathematics, best described as a mix between Maths and Physics, which teaches students how to solve physical problems through the use of mathematics. People often think Applied Maths means “advanced maths”, and that it is only for the very top maths students. In reality, it is a subject that uses what students will have learned in their regular maths lessons, and shows how this can be applied in real life scenarios.

Applied Maths is a wonderful subject which gives students the skill of problem solving, and one that will be of huge benefit to anyone thinking of studying Engineering, Architecture, Maths or Science at third level. It is studied and assessed at both Ordinary and Higher levels.
